PUI Assignment 7
Andrew Siheon Lee
Section B

The target users of my website would be recruiters and people who would likely to know more about me. I want my users would understand that I am both a UX designer and a UX engineer, especially would emphasize my capabilities to design and develop digital products. Because I have three projects, I decided not to choose any design techniques to show multiple options into one point of entry such as grids and a table with various columns but instead chose to put one work big enough so that a user's eye would focus only on it. In the final assignment, I will submit different projects on my portfolio because I have some in progress. After I have finished and uploaded them on my website, the contents would naturally bring up to users' perception that I am highly interested in data visualization works, Augmented Reality, and mobile applications. Mainly, I have put my image of the project on my home page, and just looking the photos would tell what I like and what kinds of fields I am specialized.

I am thinking about using React.js or Vue.js for my portfolio. I certainly need ways to show effective interactions to help users follow the flow I intended to present. Because I have never used both of them, I would like to hear which one is better for a portfolio website to implement interactions.
